

Package: MLpreemption (via r-universe)

August 25, 2024

Type Package

Title Maximum Likelihood Estimation of the Niche Preemption Model

Version 1.0.1

Date 2021-02-07

Author Jan Graffelman [aut, cre]

Maintainer Jan Graffelman <jan.graffelman@upc.edu>

Depends R (>= 1.8.0)

Description Provides functions for obtaining estimates of the parameter of the niche preemption model (also known as the geometric series), in particular a maximum likelihood estimator (Graffelman, 2021) <doi:10.1101/2021.01.27.428381>. The niche preemption model is a widely used model in ecology and biodiversity studies.

Fattorini	<i>Australian bird abundances.</i>
-----------	------------------------------------

Description

The data sets consists of the names and abundances of 31 Australian birds.

Usage

```
data("Fattorini")
```

Format

A data frame with 31 observations on the following 2 variables.

Species a character vector

Abundance a numeric vector

References

Fattorini, S. (2005) A simple method to fit geometric series and broken stick models in community ecology and island biogeography. *Acta Oecologica* 28: pp. 199-205.

Examples

```
data(Fattorini)
```

Ganeshaiiah	<i>Indian dung beetles from Ganeshaiiah et al. (1997)</i>
-------------	---

Description

The data sets consists of the names and abundances of 16 dung beetles

Usage

```
data(Ganeshaiiah)
```

Format

A data frame with 16 observations on the following 2 variables.

Species a character vector

Abundance a numeric vector

References

Examples

```
data(Ganeshiah)
```

k_hetang

Preemption parameter estimation by He and Tang

Description

Calculates the He-Tang estimator for the geometric series.

Usage

```
k_hetang(x)
```

Arguments

x A vector of counts

Value

a real number

Note

Zero counts are discarded prior to calculation of the estimator.

Examples

```
data("Ganeshaiiah")
x <- Ganeshaiiah[,2]
k_hetang(x)
```

k_ls

Preemption parameter estimation by least squares regression

Description

Calculates the least-squares estimator for the geometric series.

Usage

```
k_ls(x)
```

Arguments

x A vector of ordered counts (from large to small)

Value

khat	estimate of the preemption parameter
k.ll	lower limit of the confidence interval
k.ul	upper limit of the confidence interval
aic	Akaike's information criterion
logl	log-likelihood

Note

counts should be ordered from large to small.

Examples

```
data("Ganeshaiiah")
x <- Ganeshaiiah[,2]
k_ls(x)
```

k_may

Preemption parameter estimation by the equation of May

Description

Calculates the estimator of May for the geometric series.

Usage

```
k_may(xs, exclude = TRUE)
```

Arguments

xs	A vector of ordered counts
exclude	Automatically exclude zeros (if exclude=TRUE)

Details

Solves May equation by using uniroot.

Value

a real value

Note

counts should be ordered from large to small.

Examples

```
data("Ganeshaiiah")
x <- Ganeshaiiah[,2]
k_may(x)
```

k_ml

Preemption parameter estimation by maximum likelihood.

Description

Calculates the maximum likelihood estimator for the geometric series.

Usage

```
k_ml(xs, closed = FALSE, ll = 0.001, ul = 0.999)
```

Arguments

xs	A vector of ordered counts (form large to small)
closed	If closed=TRUE a closed form approximation to the ML estimator will be calculated; otherwise the exact ML estimator is calculated iteratively.
ll	Lower limit for the root searching algorithm
ul	Upper limit for the root searching algorithm

Value

a real value

Note

counts should be ordered from large to small.

x <- Ganeshaiiah[,2]
k_ml(x)
```

Mehrabi

Costa Rica dung beetle counts from Mehrabi et al. (2014)

Description

The data sets consists of the names and total abundances of 31 dung beetles along 16 transects (A, B, ... P). Transects A, C, ..., O used randomly placed traps (control), whereas transects B, D, ..., P used microhabitat standardized traps (treatment).

Usage

```
data("Mehrabi")
```

Format

A data frame with 31 observations on the following 16 variables.

A a numeric vector

B a numeric vector

C a numeric vector

D a numeric vector

E a numeric vector

F a numeric vector

G a numeric vector

H a numeric vector

I a numeric vector

J a numeric vector

K a numeric vector

L a numeric vector

M a numeric vector

N a numeric vector

O a numeric vector

P a numeric vector

```

preemption.fit	<i>Estimation of the preemption parameter of a geometric series by various methods</i>
----------------	--

Description

Function `preemption.fit` can estimate the preemption parameter of a geometric series by four specific methods, or list all estimates simultaneously for comparison.

Usage

```
preemption.fit(x, method = "ml", closed = FALSE, verbose = TRUE)
```

Arguments

<code>x</code>	Vector of counts (abundances of species)
<code>method</code>	Estimation method ("ml" = maximum likelihood, "ls" = least squares, "May" = May's equation, "HT" = He-Tang's equation, "all" = lists all four estimators)
<code>closed</code>	If <code>closed=FALSE</code> the exact value of the ML estimator will be calculated by iteration, if <code>closed=TRUE</code> a good closed-form approximation is given
<code>verbose</code>	The function is silent if <code>verbose=FALSE</code> or prints results if <code>verbose=TRUE</code>

Value

<code>khat</code>	the estimate of the preemption parameter
<code>ll</code>	lower limit of 95 confidence interval
<code>ul</code>	upper limit of 95 confidence interval

[preemption.t](#)

Examples

```
data(Ganeshaiiah)
preemption.fit(Ganeshaiiah[,2])
```

preemption.t	<i>Preemption t test</i>
--------------	--------------------------

Description

Function `preemption.t` implements a t test for comparing the preemption parameters of the geometric series for two samples.

Usage

```
preemption.t(x1, x2, verbose = TRUE)
```

Arguments

x1	Species counts for the first sample
x2	Species counts for the second sample
verbose	The function is silent if <code>verbose=FALSE</code> or prints results if <code>verbose=TRUE</code>

Value

Tstat	The t statistic
df	The degrees of freedom
pval	The p-value of the test

Examples

```
data(Mehrabi)
x <- sort(Mehrabi[,1],decreasing=TRUE)
y <- sort(Mehrabi[,2],decreasing=TRUE)
results <- preemption.t(x,y)
```

`raplot`*Rank-abundance plot*

Description

Function `raplot` creates a rank-abundance plot online, and can show decaying lines fitted by various method.

Usage

```
raplot(x, xlab = "Species rank", ylab = "log (Relative abundance)",  
      main = "Rank-Abundance plot", reflines = c(1, 2, 3, 4), alpha = 0.05, leg = FALSE)
```

Arguments

<code>x</code>	Vector of counts (species abundances)
<code>xlab</code>	Label for the x axis
<code>ylab</code>	Label for the y axis
<code>main</code>	Title for the plot
<code>reflines</code>	Lines to be drawn in the plot: 1=ML, 2=LS, 3=May, 4=He-Tang
<code>alpha</code>	Significance level (0.05 by default)
<code>leg</code>	Show legend <code>leg=TRUE</code> or not <code>leg=FALSE</code>

Value

NULL

data(Fattorini)  
raplot(Fattorini[,2])
```

raplot.paired	<i>Rank-abundance plot for two samples</i>
---------------	--

Description

Function `raplot.paired` creates a rank-abundance plot on screen, and can show decaying lines with uncertainty zones for two samples fitted by maximum likelihood.

Usage

```
raplot.paired(x, y, xlab = "Species rank", ylab = "log (Relative abundance)",  
             main = "Rank-abundance", sym = c(1, 2), alpha = 0.05)
```

Arguments

<code>x</code>	Count vector of the first sample
<code>y</code>	Count vector of the second sample
<code>xlab</code>	Label x axis
<code>ylab</code>	Label y axis
<code>main</code>	Main title for the plot
<code>sym</code>	Symbols for first and second sample (c(1,2) by default)
<code>alpha</code>	Significance level (0.05 by default)

Value

NULL
